Patent No. 6245503
GENERAL INFORMATION:
APPLICANT: MAERTENS, GERT
APPLICANT: BOSMAN, FONS
APPLICANT: DE MARTYNOFF, GUY
APPLICANT: BUYSE, MARIE-ANGE
TITLE OF INVENTION: PURIFIED HEPATITIS C VIRUS ENVELOPE
TITLE OF INVENTION: PROTEINS FOR DIAGNOSTIC AND THERAPEUTIC USE
NUMBER OF SEQUENCES: 111
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   COMPUTER READABLE FORM:

Purifying recombinant hepatitis C virus (HCV) El and E2 envelope

NPI; 1996-129401/13

TAATAG 606

601

```
AATI2704-T12709 and AAT12961-T12974 represent hepatitis C virus (HCV) El and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins.

C in vectors for the production of recombinant E1, E2, and E1/E2 proteins.

C in the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a carrying out a disulphide bond cleavage, or a reduction step with a carrying out a disulphide bond cleavage, or a reduction step with a crarying out a sample, and in a serotyping assay for detecting one or antibodies in a sample, and in a serotyping assay for detecting one or constructs can also be immobilised on a solid substrate and incorporated control of HCV. The new purification method presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and climinates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         541 ATGATGATGAACTGGTCGCCTACAACGGCCCTGGTATCGCAGCTGCTCCGGATCCTC 600

The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV) -specific antibodies, comprising a inducing hepatitis C virus (HCV) -specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an B1 and specific oligomeric recombinant envelope proteins aclected from an B1 and useful for inducing HCV-specific antibodies or for immunising humans useful for inducing HCV-specific antibodies or for immunising humans vaccines or therapeutics, in HCV B1 and/or E2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody in vitro monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present sequence is a coding sequence described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CTCTTGGCTTTGCTGTCCTGTCTGACCGTTCCAGCTTCCGCTTATGAAGTGCGCAACGTG 240

invention. In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage agent, after lysis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV more serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed El. E2 and El/E2, and eliminates contaminating proteins. Antigens isolated using this method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           121 CTGGAGGACGGCGTGAACTATGCAACAGGGAATTTGCCCCGGTTGCTCTTTCTCTATCTTC 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HV single or specific oligomeric recombinant envelope proteins selected from an B1 and an B2 protein, and optionally a pharmaceutical adjuvant. The vaccines useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV B1 and/or B2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present sequence is a coding sequence described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 cogeregeogeococceragasaseceraceaasacerasecarasecarecessrr 120

AATI2704-TI2709 and AATI2961-TI2974 represent hepatitis C virus (HCV) El and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins.

C in vectors for the production of recombinant E1, E2, and E1/E2 proteins.

C in vectors for the production of recombinant hod of the invention. In the method, the envelope proteins are purified by a carrying out a disulphide bond cleavage, or a reduction step with a carrying out a disulphide bond cleavage agent, after lysis of recombinant host cells.

C for constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a scrotyping assay for detecting one or antibodies types of HCV present in a biological sample.

C constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the 540 900 480 480 420 420 HCV; E1; E2; disulphide bond cleavage; envelope protein; vaccine; human; serotype; reversed phase hybridisation assay; genotype; antigen; sera; 541 ATGATGATGAACTGGTCGCCTACAACGGCCCTGGTGGTATCGCAGCTGCTGCGGATCCTC CAGGACTGCAATTGCTCAATCTATCCCGGCCACATAACGGGTCACCGTATGGCTTGGGAT TGCTGGGTAGCGCTCACCCCCACGCAGCTAGGAACGCCAGCGTCCCCACCACGACA ATACGACGCCACGTCGATTCCCCAGCTGTTCACCATCTCGCCTCGCCGGCATGAGACGGTG Purifying recombinant hepatitis C virus (HCV) El and E2 envelope proteins - in presence of disulphide bond cleavage agent, to produce proteins suitable for direct use in vaccines or diagnostic assays of HCV Maertens G; De Martynoff G, Claim 23; Fig 21; 146pp; English. The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligometric recombinant envelope proteins selected from an B1 and an B2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV B1 and/or B2 proteins are useful as vaccines or therapeutica, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AMTI2704-TI2709 and AATI2961-TI2974 represent hepatitis C virus (HCV) El and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant proteins of the production of recombinant proteins are then be isolated using a method of the carrying out a disulphide bond cleavage, or a reduction step with a carrying out a disulphide bond cleavage, or a reduction step with a carrying out a disulphide bond cleavage agent, after 1/sis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used to vaccinating humans against HCV, for in vitro detecting one or antibodies in a sample, and in a serotyping assay for detecting one or constructs can also be immobilised on a solid substrate and incorporated constructs can also be immobilised on a solid substrate and incorporated the agencype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and conformation of the recombinantly expressed E1, E2 and E1/E2, and conformation energy in the presence is a more reactive with human sera than those isolated by known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an B1 and an B2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV B1 and/or E2 proteins are useful as vecines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present sequence

and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant proteins can then be isolated using a method of the invention. In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a canstructs containing the purified HVV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180

The vaccines useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV B1 and/or B2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present sequence

```
AAT12704-T12709 and AAT12961-T12974 represent hepatitis C virus (HCV) E1
and E2 protein coding sequence constructs. These sequences are included
the vectors for the production of recombinant E1, E2, and E1/E2 proteins.
The recombinant proteins can then be isolated using a method of the
invention. In the method, the envelope proteins are purified by
carrying out a disulphide bond cleavage for a reduction step with a
disulphide bond cleavage agent, after lysis of recombinant host cells.
The constructs containing the purified HCV envelope proteins can be used
for vaccinating humans against HCV, for in vitro detection of HCV
continues serological types of HCV present in a biological sample. The
constructs can also be immobilised on a solid substrate and incorporated
into a reversed phase hybridisation assay for determining the presence or
the genotype of HCV. The new purification method preserves the
conformation of the recombinantly expressed E1, E2 and E1/E2, and
eliminates contaminating proteins. Antigens isolated using this method
conformation with human sera than those isolated by known

                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an E1 and an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV E1 and/or E2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             363
